

The Problem & Vision

Healthcare access shouldn't depend on geography, wealth, language, or phone type.

Millions of people in remote and underserved regions face critical delays during medical emergencies — not because care doesn't exist, but because they have no way to triage or find it quickly.

The reality

Villages far from urban centers routinely lose precious hours simply figuring out whether something is an emergency, and where to go.

The SAHAY vision

A lightweight, AI-guided mobile platform that bridges rural patients and professional healthcare networks — seamlessly, and on the phone they already own.
